

Moab Cloud HPC Suite

Ease-of-Use Driven Productivity

Moab® Cloud HPC Suite is a workload and resource orchestration platform that automates the scheduling, managing, monitoring, and reporting of HPC workloads on massive scale. The patented Moab Cloud intelligence engine uses multi-dimensional policies and advanced future modeling to optimize workload start and run times on diverse resources.

These policies balance high utilization and throughput goals with competing workload priorities and SLA requirements, thereby accomplishing more work in less time and in the right priority order. Moab Cloud HPC Suite optimizes the value and usability of HPC systems while reducing management cost and complexity.

Drive Higher ROI and SLA's

The patented Moab Cloud intelligence engine uses multi-dimensional policies and advanced future modeling to optimize resource efficiency on heterogeneous clusters and align usage to SLA's that match business objectives.

Resource Efficiency on Heterogeneous Clusters

As clusters are scaled up to meet the needs of multiple groups, inevitably the application requirements of those groups require different resource configurations to optimize their application performance. Moab Cloud's advanced resource management effectively controls and optimizes resources in complex or heterogeneous HPC environments.

Moab Cloud includes capabilities that allow it to aggregate local resources, incorporate information from remote tools or custom fields into scheduling decisions, apply unique policies to groupings of nodes, and add fine-tuned controls over workload placement on resources.

These capabilities will enhance scheduling decisions in complex environments, boost application performance through better resource matching, and improve overall system utilization. To accomplish this, Moab Cloud utilizes node sets, NUMA, multi-resource manager support, and node allocation policies. Other features include Docker Support, Malleable Jobs, Remap Classes, Generic Metrics, and Generic Events.

Usage Alignment to SLA's and Business Objectives

As multiple groups begin to utilize a cluster, their competing needs and usage behaviors will inevitably cause conflict. Therefore, service guarantees are important to help ensure the system is utilized in a way that completes the "most important" work for achieving the organization's top objectives.

With Moab Cloud's group-sharing policies, organizations get the controls they need to efficiently share a cluster between multiple groups and the ability to align resource usage to business objectives, while still maintaining high utilization. Example capabilities include Account and QoS credential rights, Hierarchical Fairshare, Advanced Prioritization, Preemption, and Administrative Reservations. Other features include Job Deadlines and Personal Reservations.

Moab Cloud for cloud bursting

Moab Cloud has been enhanced to burst HPC workloads into public clouds based on backlog violation of SLA's and other criteria. It allows you to access as many resources as you want, run your HPC job, then shut down the HPC cluster in the cloud effectively and cleanly and bring everything back on premise.

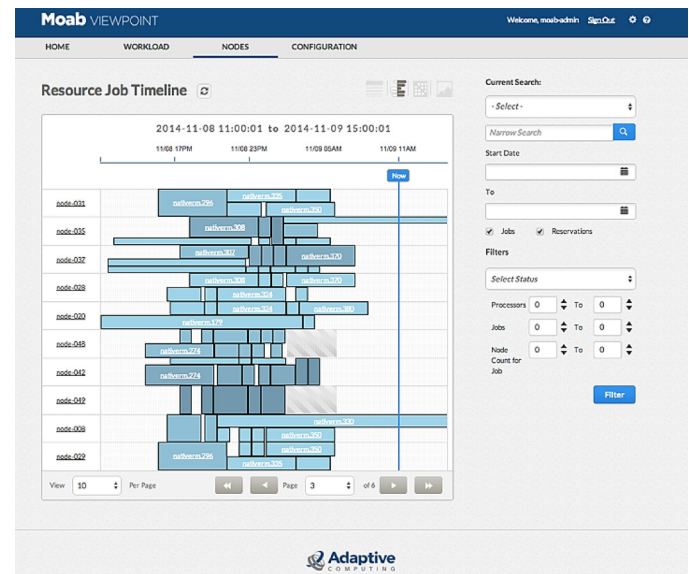

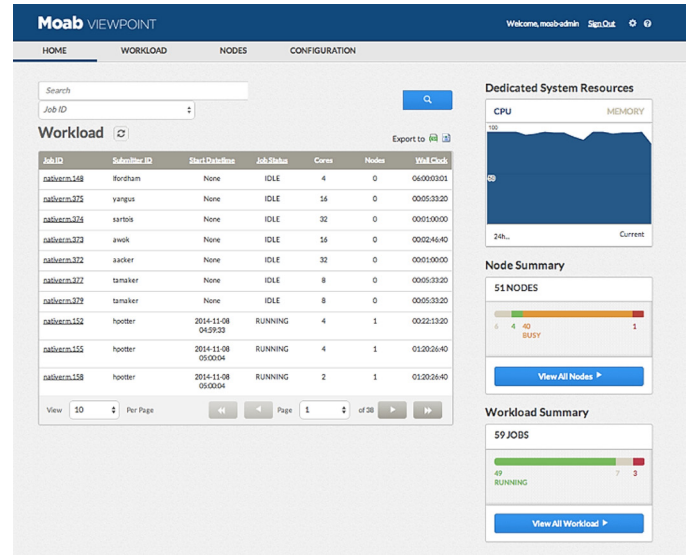

Moab Cloud HPC Suite	Moab Cloud	Moab Cloud Multi-Scheduler Support
On-premise scheduling	Cloud bursting enabled	Multi-scheduler support with cloud bursting
Completeness, polish and ease-of-use	Spin up and spin down resources very effectively and cleanly	Not just the Adaptive ecosystem
Exceptional resource utilization on-premise	When you need additional resources, you can easily burst to the cloud	Can incorporate other scheduling stacks

Moab Cloud HPC Suite

Support and Value-Added Modules

Adaptive Computing offers commercial support as well as other value added features that can be purchased to extend this basic foundation. These capabilities facilitate such things as portal-based job submission, accounting, workflow management, grid management, elastic computing, power management, high throughput submission, and remote visualization. Add these powerful modules according to specific needs.

- **Viewpoint** - Simplify the workload submission process for end-users with an easy-to-use job submission portal, which includes features like application templates, script builders, job details, and web-based file management.
- **Accounting** - Flexibly track and charge for resource or service usage. Perform deposits, withdrawals, transfers, and refunds while providing balance and usage feedback to users, managers, and system administrators.
- **Workflow Management** - Perform health checks, handle failures, develop workflows, and provision/re-purpose nodes through a trigger-based workflow engine, enabling end-to-end automated processes.
- **Grid Management** - Enable unified scheduling, intelligent policy management, integrated resource management, data staging, and consolidated monitoring and management across multiple clusters.
- **Elastic Computing** - Manage resource expansion and contraction of bursty workloads utilizing additional resources from private clouds or other data centers.
- **Power Management** - Automate individual, per-application CPU clock frequencies and lower the power state of idle nodes using the Green Pool Buffer Policy, minimizing energy costs while preserving performance.
- **Nitro** - Accelerate launch times for large volumes of small jobs. This HTC scheduler packages these many tasks into group requests and launches them up to hundreds of times faster than traditional schedulers.
- **Remote Visualization** - Avoid purchasing high-end desktops for all workers, instead sharing expensive licenses or GPU's, by rendering applications remotely and visualizing locally through an integrated portal.

Intelligent Workload Management

With a proven history of managing the most advanced, diverse, and data-intensive systems in the Top500, Moab Cloud HPC Suite continues to be the preferred workload management solution for next-generation HPC facilities.
